

1 **ABSTRACT**

2 A strategy is described for assisting a supplier in updating code without negatively
3 impacting preexisting applications that may interact with the original or updated code.
4 In this strategy, a resource is transferred from a first code module to a second code
5 module. So that the applications that utilize the resource can continue to access this
6 resource, the strategy adds forwarding information to a new version of the first code
7 module. The forwarding information provides a note which shows the Common
8 Language Runtime (CLR) where to find the specified resource when the code modules
9 are executed.
